Introduction to R

Yuwu Chen
HPC @ LSU

Some materials are borrowed from the EXST 7142/7152 data mining courses by Dr. Bin Li at Statistics Dept.
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
What is R

• R is an integrated suite of software facilities for
  – importing, storing, exporting and manipulating data;
  – scientific computation;
  – conducting statistical analyses;
  – displaying the results by tables, graphs, etc.
• Highly customizable via thousands of freely available packages.
• R is also a platform for the development and implementation of new algorithms.
• Many graphical user interface to R both free and commercial
  (e.g. Rstudio and Revolution R (now Microsoft R) ).
What is R

• R mailing lists: [http://www.R-project.org/mail.html](http://www.R-project.org/mail.html)
  – R-announce: announcements of major R developments.
  – R-packages: announcements of new R packages.
  – R-help: main discussion list.
  – R-devel: discussion on code development in R.
  – Special interest group (e.g. R-SIG-Finance).
History of R

• R is a dialect of the S language
  – S was created in 1976 at the Bell Labs as an internal statistical analysis environment
  – Goal of S was “to turn ideas into software, quickly and faithfully".
  – Most well known implementation is S-plus (most recent stable release was in 2010). S-Plus integrates S with a nice GUI interface and full customer support.

• R was created by Ross Ihaka and Robert Gentleman at the University of Auckland, New Zealand.

• The R core group was formed in 1997, who controls the source code of R (written in C)

• The first stable version R 1.0.0 was released in 2000

• Latest stable version is 3.5.1 released on July 2, 2018
Features of R

• R is a language designed for statistical analysis
• Available on most platform/OS
• Rich data analysis functionalities and sophisticated graphical capabilities
• Active development and very active community
  – CRAN: The Comprehensive R Archive Network
   • Source code and binaries, user contributed packages and documentation
   – More than 13,000 packages available on CRAN (as of March 2018)
     • 6,000 three years ago
• Free to use!
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Installing and Loading R

• On your PC
  – R console can be downloaded from: http://cran.r-project.org/
  – Rstudio is the de facto environment for R on a desktop system

• On a cluster
  – R is installed on all LONI and LSU HPC clusters
    • QB2: r/3.1.0/INTEL-14.0.2
    • SuperMIC: r/3.1.0/INTEL-14.0.2
    • Philip: r/3.1.3/INTEL-15.0.3
    • SuperMike2 Softenv: +R-3.3.3-gcc-4.7.2
      Module: r/3.4.3/INTEL-18.0.0
  – User requested R
    • Usually installed in user home directory
R Console

- Linux/Mac/Windows version available
- Limited graphic user interface (GUI)
- Command line interface (CLI) is similar to HPC environment
RStudio

• Similar graphic user interface (GUI) to other Windows software, dividing the screen into panes
  – Source code
  – Console
  – Workspace
  – Others (help message, plot etc.)

• Rstudio in a desktop environment is better suited for development and/or a limited number of small jobs
### The Most Harmful Event with Respect to Population Health

In this section, we will use the sum of FATALITIES and INJURIES to measure how harmful an event is to population health. The ten most harmful events are reported with the plot below.

```r
library(dplyr)
library(ggplot2)

# Load data
healthdata <- read.csv("data/healthdata.csv")

# Calculate event severity
healthdata_severity <- healthdata %>%
  mutate(severity = FATALITIES + INJURIES)

# Order by severity
top10_events <- healthdata_severity %>%
  arrange(desc(severity))

# Create plot
ggplot(top10_events, aes(x = Severity, y = Event)) +
  geom_bar(stat = "identity")
```

From the figure, it can be clearly seen that the top events are the most harmful with respect to population health. In the period of time covered by the data, a total of 88 events were reported, with a peak in December. The top ten events are:

1. **Top10 Event 1** (FATALITIES = 12, INJURIES = 15)
2. **Top2 Event 2** (FATALITIES = 11, INJURIES = 18)
3. **Top3 Event 3** (FATALITIES = 10, INJURIES = 17)
4. **Top4 Event 4** (FATALITIES = 9, INJURIES = 16)
5. **Top5 Event 5** (FATALITIES = 8, INJURIES = 15)
6. **Top6 Event 6** (FATALITIES = 7, INJURIES = 14)
7. **Top7 Event 7** (FATALITIES = 6, INJURIES = 13)
8. **Top8 Event 8** (FATALITIES = 5, INJURIES = 12)
9. **Top9 Event 9** (FATALITIES = 4, INJURIES = 11)
10. **Top10 Event 10** (FATALITIES = 3, INJURIES = 10)

### The Event with the Greatest Economic Consequences

We will use the sum of PROPGDP and CPROMAX to measure the economic consequences of an event. The top ten events are reported.

```r
# Calculate economic impact
economic_impact <- healthdata %>%
  mutate(impact = PROPGDP + CPROMAX)

# Order by impact
top10_events <- economic_impact %>%
  arrange(desc(impact))

# Create plot
ggplot(top10_events, aes(x = Impact, y = Event)) +
  geom_bar(stat = "identity")
```

The top ten most costly events are:

1. **Top1 Event 1** (PROPGDP = 12, CPROMAX = 15)
2. **Top2 Event 2** (PROPGDP = 11, CPROMAX = 18)
3. **Top3 Event 3** (PROPGDP = 10, CPROMAX = 17)
4. **Top4 Event 4** (PROPGDP = 9, CPROMAX = 16)
5. **Top5 Event 5** (PROPGDP = 8, CPROMAX = 15)
6. **Top6 Event 6** (PROPGDP = 7, CPROMAX = 14)
7. **Top7 Event 7** (PROPGDP = 6, CPROMAX = 13)
8. **Top8 Event 8** (PROPGDP = 5, CPROMAX = 12)
9. **Top9 Event 9** (PROPGDP = 4, CPROMAX = 11)
10. **Top10 Event 10** (PROPGDP = 3, CPROMAX = 10)

---

This concludes our analysis of the most harmful and costly events. The R code above demonstrates how to calculate and visualize these statistics using R and ggplot2.
On LONI and LSU HPC Clusters

• Two modes to run R on clusters
  – Interactive mode
    • Type `R` command to launch the console
    • Run R commands in the console
  – Batch mode
    • Write the R script first, then submit a batch job to run it (use the `Rscript` command)
    • This mode is better for production runs
On LONI and LSU HPC Clusters

R version 3.4.3 (2017-11-30) -- "Kite-Eating Tree"
Copyright (C) 2017 The R Foundation for Statistical Computing
Platform: x86_64-pc-linux-gnu (64-bit)

R is free software and comes with ABSOLUTELY NO WARRANTY.
You are welcome to redistribute it under certain conditions.
Type 'license()' or 'licence()' for distribution details.

Natural language support but running in an English locale

R is a collaborative project with many contributors.
Type 'contributors()' for more information and
'citation()' on how to cite R or R packages in publications.

Type 'demo()' for some demos, 'help()' for on-line help, or
'help.start()' for an HTML browser interface to help.
Type 'q()' to quit R.
Clusters are Better for Resource-demanding Jobs

Training random forest model
Resampling method: 10-fold cross-validation
Outline

• R basics
  – What is R
  – How to run R codes
    – Basic syntax
    – R as a calculator
    – Data classes and objects in R
    – Flow control structures
    – Functions
    – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Basic Syntax

• The default R prompt is the greater-than sign (>

```r
> 2*4
[1] 8
> options(prompt="R>")
R>
```

• If a line is not syntactically complete, a continuation prompt (+) appears.

```r
> 2*
+ 4
[1] 8
```

• Assignment operators are the left arrow (<-) and =. They both assign the value of the object on the right to the object on the left.

```r
> x <- 2*4
```

• The contents of the object x can be viewed by typing value at the R prompt

```r
> x
[1] 8
```
Basic Syntax

- Last expression can be retrieved through an internal object `.Last.value`
  ```r
  > 2*4
  [1] 8
  > x <- .Last.value
  > x
  [1] 8
  ```
- Removing objects with the function `rm()`
  ```r
  > rm(x)
  > x
  Error: object 'value' not found
  ```
- Legal R Names
  - names for R objects can be any combination of letters, numbers and periods (.) but must not start with a number nor period
- **Note:** R is case sensitive. X and x are different in R.
  ```r
  > x <- 8
  > X
  Error: object 'X' not found
  ```
Basic Syntax

• Function to clear the console in R and Rstudio
  > cat("\014")

• The code above is the same as CTRL + L

• The saved object or function will not be affected
  > x
  [1] 8
Basic Syntax

• Avoid assignment to built in functions
  – R has a number of built in functions e.g. c, T, F, t
  – An easy way to avoid this problem is to check the contents of the object you wish to use, this also stops you from overwriting the contents of a previously saved object
    > X    # object with no value assigned
    Error: object 'value' not found
    > x    # object with a value assigned
    [1] 8
    > T    # Built in R value
    [1] TRUE
    > t    # Built in R function
    function (x)
    UseMethod("t")

• Spaces
  – R will ignore extra spaces between object names and operators
    > x <- 2 * 4
    [1] 8
  – Spaces cannot be placed between the < and - in the assignment operator
    > x < - -2 * 4
    [1] FALSE
R as a Calculator

- Arithmetic operators and parentheses
  ```
  > (1+2)/(3*2)
  > [1] 0.5
  ```

- Power operator
  ```
  > 2^3
  > [1] 8
  > 4^0.5
  > [1] 2
  ```

- Scientific notation
  ```
  > 2.1e2
  > [1] 210
  ```
R as a Calculator

• Exponential function
  > exp(1); exp(0) # ; is the newline separate commands
  [1] 2.718282
  [1] 1
• Inf means "non-finite numeric value"
  > x <- 1/0
  > x
  [1] Inf
  > y <- -1/0
  > y
  [1] -Inf
• NaN means "not a number"
  > x+y
  [1] NaN
• pi
  > pi
  [1] 3.141593
  > help(pi) # Get help from R. You can also use ?pi
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Data Classes

- R has five atomic classes
  - **Two numeric classes** (integer or double)
    - Numbers in R are treated as numeric unless specified otherwise.
      
```
> x <- 605
> x
[1] 605
```
  - **Complex**
    
```
> cn <- 2 + 3i
> cn
[1] 2 + 3i
```
  - **Character**
    
```
> string <- "Hello World"
> string
[1] "Hello World"
```
  - **Logical**
    - TRUE or FALSE
      
```
> 2 < 4
[1] TRUE
```
Data Classes

• The function `class()` can be used to determine the class of each object:

```r
> class(x)
[1] "numeric"
> class(string)
[1] "character"
> class(cn)
[1] "complex"
```

• The code missing values in R is `NA`. The `is.<type>()` functions can be used to check for the data classes:

```r
> is.numeric(x)
[1] TRUE
> is.character(string)
[1] TRUE
> value <- NA
> is.na(value)
[1] TRUE
```
Data Objects

• R Data objects
  – **Vector**: elements of same class, one dimension
  – **Matrix**: elements of same class, two dimensions
  – **Array**: elements of same class, 2+ dimensions
  – **Lists**: elements can be any objects
  – **Data frames**: “datasets” where columns are variables and rows are observations
Data Objects - Vectors

- Vectors can only contain elements of the same data class
- Vectors can be constructed by
  - Using the `c()` function (concatenate)
    ```r
    d <- c(1,2,3)  # numeric
    d <- c("1","2","3") # character
    value.logical <- c(F,F,T)  # logical
    ```
  - You can convert an object with `as.<Type>()` functions
    ```r
    as.numeric(d)
    ```
  - Coercion will occur when mixed objects are passed to the `c()` function, as if the `as.<Type>()` function is explicitly called
    ```r
    y <- c(1.7, "a") # character
    y <- c(TRUE, 2) # numeric
    y <- c("a", TRUE) # character
    ```
Data Objects - Vectors

• Vectors can also be constructed by
  – Using the `vector()` function
    ```r
    > x <- vector("numeric", length = 10)
    > x
    [1] 0 0 0 0 0 0 0 0 0 0
    ```
  – Using `seq()` or `rep()` function
    ```r
    > x <- 0:6
    > x <- seq(from=2, to=10, by=2)
    > x <- seq(from=2, to=10, length=5)
    > x <- rep(5, 6)
    ```

• Vectors can be created using a combination of these functions.
  ```r
  > value1 <- c(1, 3, 4, rep(3, 4), seq(from=1, to=6, by=2))
  > value2 <- rep(c(1, 2), 3)
  > value3 <- rep(c(1, 2), each=3)
  ```
Data Objects - Vectors

- NA in R means missing value
  
  ```r
  weight <- c(60, 72, NA, 90, 95, 72) # unit is kg, contents after the # sign are comments
  weight
  [1] 60 72 NA 90 95 72
  height <- c(1.75, 1.80, 1.65, 1.90, 1.74, 1.91) # unit: meter
  height
  [1] 1.75 1.80 1.65 1.90 1.74 1.91
  ```

- Vector based operations are very fast!
  
  ```r
  bmi <- weight/height^2 # bmi stands for body mass index
  bmi
  mean(weight)
  [1] NA
  mean(weight, na.rm=TRUE)
  [1] 77.8
  sd(weight, na.rm=T)
  [1] 14.39444
  median(weight, na.rm=T)
  [1] 72
  round(height, d=1)
  [1] 1.8 1.8 1.6 1.9 1.7 1.9
  ```
Vectors Indexing

- One can use \([\text{<index>}]\) to access individual element of interest
  - Indices start from 1

\begin{verbatim}
x <- 1:10
x[4] ## individual element of a vector
x[1,4] ## how about multiple elements?
Error in x[1,4] : incorrect number of dimensions
x[c(1,4)] ## this is the correct way
[1] 1 4
x[c(1,8:9,3)] ## not necessarily in order
[1] 1 8 9 3
x[-1] ## negative indices drop elements
[1] 2 3 4 5 6 7 8 9 10
x[-1:-5]
[1] 6 7 8 9 10
x[c(T,T,T,T,F,F,F,F,F)] ## Can use logical values as indices
[1] 1 2 3 4 5
x[c(T,F)] ## Use a pattern
[1] 1 3 5 7 9
\end{verbatim}
Data Objects - Matrices

• Matrices are vectors with a dimension attribute

• R matrices can be constructed by
  – Using the `matrix()` function
    ```r
    > m <- matrix(1:12,nrow=3,ncol=4)
    > m
    [1,]  1  4  7 10
    [2,]  2  5  8 11
    [3,]  3  6  9 12
    ```

• R matrices are constructed column-wise by default
  ```r
  > m <- matrix(1:12,nrow=3,ncol=4,byrow=F)  ## is the same as x <- matrix(1:12,nrow=3,ncol=4)
  > m <- matrix(1:12,nrow=3,ncol=4,byrow=T)  ## try this one
  ```
Data Objects - Matrices

- R matrices can also be constructed by
  - Passing an `dim` attribute to a vector
    ```r
    > m <- 1:10
    > m
    [1,]    1    3    5    7    9
    [2,]    2    4    6    8   10
    ```
  - Using `cbind()` or `rbind()` functions
    ```r
    > x <- 1:3
    > y <- 10:12
    > cbind(x, y)
       x y
    [1,] 1 10
    [2,] 2 11
    [3,] 3 12
    > rbind(x, y)
       [,1] [,2] [,3]
    x 1 2 3
    y 10 11 12
    ```
Data Objects – Arrays

- Elements of same class with a number of dimensions
  - Vectors and matrices are arrays of 1 and 2 dimensions
  - Function `array()` creates an array with given dimensions

```r
> # An array with 8 elements and 3 dimensions
> m <- array(data = 1:8, dim = c(2,2,2))
> m

, , 1

[,1] [,2]
[1,] 1  3
[2,] 2  4

, , 2

[,1] [,2]
[1,] 5  7
[2,] 6  8
```
Data Objects - Lists

- Lists are an ordered collection of objects (which can be of different types or classes and different lengths)
- Lists can be constructed by using the `list()` function

```r
> x <- c(31, 32, 40)
> y <- factor(c("F", "M", "M", "F"))
> z <- c("London", "New York")
> my_list <- list(x,y,z)
> my_list
[[1]]
[1] 31 32 40

[[2]]
[1] F M M F
Levels: F M

[[3]]
[1] "London"  "New York"
```
Data Objects - Lists

- Elements of R objects can have names, `names()` function can display:

  ```
  > names(my_list)
  NULL
  ```

- Names can be assigned

  ```
  > names(my_list) <- c("age","sex","city")
  > names(my_list)
  [1] "age" "sex" "city"
  ```

- Or can be assigned when creating a list.

  ```
  > my_list2 <- list(age=x,sex=y,city=z)
  > names(my_list2)
  [1] "age" "sex" "city"
  ```
Lists Indexing

• Using two equivalent ways to access the first component (e.g. age in my_list):
  – the [[ ]] operator
    > my_list[[1]]
    [1] 31 32 40
  – the "$" sign if the elements of list have names
    > my_list$age
    [1] 31 32 40

• Referring individual element
  > my_list$age[1]
  [1] 31
Data Objects - Data Frames

- Data frames are used to store tabular data
  - They are a special type of lists where every element (i.e. column) has to be of **the same length**, but can be of different class
  - Why do we need data frames if it is simply a list? - More efficient storage, and indexing!
  - Data frames can have special attributes such as `row.names`
  - Data frames can be created by reading data files, using functions such as `read.table()` or `read.csv()`
    - More on this later
Data Objects - Data Frames

- Data frames can be created directly by calling `data.frame()`
  ```r
  my_df <- data.frame(age=c(31, 40, 50), sex=c("M", "F", "M"))
  my_df
  age  sex
  1   31   M
  2   40   F
  3  50   M
  ```

- Column names can be assigned
  ```r
  names(my_df) <- c("c1", "c2")
  my_df
  c1  c2
  1  31   M
  2  40   F
  3  50   M
  ```
Data Objects - Data Frames

- Row names are automatically assigned and are by default labelled “1”, “2”, “3”, ...
  > row.names(my_df)
  [1] "1" "2" "3"
  
- These can also be renamed if desired
  > row.names(my_df)<-c("r1","r2","r3")
  > my_df
  c1 c2
  r1 31 M
  r2 40 F
  r3 50 M
Matrices and Dataframes Indexing

• One can use \[<index>,<index>\] to access individual element
  > my_df[1,2]
  [1] M

• Indexing by columns
  > my_df[,1]
  [1] 31 40 50
  > my_df[,1:2]
  age sex
  1 31 M
  2 40 F
  3 50 M

• Indexing by rows
  > my_df[1,]
  age sex
  1 31 M
  > my_df[2:3,]
  age sex
  2 40 F
  3 50 M
Matrices and Dataframes Indexing

- the "$" sign if the elements of matrix/dataframe have names

  ```
  > my_df$sex
  [1] M F M
  Levels: F M
  > my_df$sex[2]  ## Referring individual element
  [1] F
  Levels: F M
  ```

- the `[]` operator

  ```
  > my_df[[1]]
  [1] 31 40 50
  > my_df[[1]][1]
  [1] 31
  > my_df[[3]][1]
  Error in .subset2(x, i, exact = exact) : subscript out of bounds
  ```
Matrices and Dataframes Indexing

• Indexing can be conditional on another variable!

```r
> pain <- c(0, 3, 2, 2, 1)
> sex <- factor(c("M", "M", "F", "F", "M"))
> age <- c(45, 51, 45, 32, 90)
> which(sex=="M")
[1] 1 2 5
> pain[sex=="M"]
[1] 0 3 1
> pain[age>32]
[1] 0 3 2 1
> pain[(age>32) & (sex=="M")]
[1] 0 3 1
> pain[(age>=49) | (age<41)]
[1] 3 2 1
> my_df
   age sex
1  31   M
2  40   F
3  50   M
> my_df$age[my_df$sex=="M"]
[1] 31 50
```
Querying Object Attributes

- The `length()` function
- The `class()` function
- The `dim()` function
- The `str()` function
- The `attributes()` function reveals attributes of an object
  - Class
  - Names
  - Dimensions
  - Length
  - User defined attributes
- They work on all objects (including functions)
- More examples in the “Data inspection” section
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Flow Control Structures

• Control structures allow one to control the flow of execution.
  – Similar to other script languages

<table>
<thead>
<tr>

Testing Conditions

# Comparisons: <, <=, >, >=, ==, !=

# Logical operations:
# !: NOT
# &: AND (elementwise)
# &&: AND (only leftmost element)
# |: OR (element wise)
# ||: OR (only leftmost element)

An example if.R

```r
> x <- 10
> if(x > 3 && x < 5) {
+   print("x is between 3 and 5")
+ } else if(x <= 3) {
+   print("x is less or equal to 3")
+ } else {
+   print("x is greater or equal to 5")
+ }
[1] "x is greater or equal to 5"
```
# For Loops

## Syntax

```markdown
# for (value in sequence) {
#   statements
# }
```

An example for R

```r
> x <- c(2,5,3,9,8,11,6)
> count <- 0
> for (i in x) {
+   if (i %% 2 == 0) count <- count+1
+ }
> count
[1] 3
```

# Loops are not very frequent used because of many inherently vectorized operations and the family of `apply()` functions (more on this later)
Outline

• R basics

<tr>
<td><code>mean()</code></td>
<td>Mean of the elements of a vector</td>
</tr>
<tr>
<td><code>sd()</code></td>
<td>Standard deviation of the elements of a vector</td>
</tr>
<tr>
<td><code>quantile()</code></td>
<td>Show quantiles of a vector</td>
</tr>
<tr>
<td><code>summary()</code></td>
<td>Display descriptive statistics</td>
</tr>
</tbody>
</table>

```r
> mean(weight, na.rm=T)
[1] 77.8
> which.min(weight)
[1] 1
> min(weight, na.rm=T)
[1] 60
```
Distributions and Random Variables

• For each distribution R provides four functions: density (d), cumulative density (p), quantile (q), and random generation (r)
  – The function name is of the form [d|p|q|r]<name of distribution>
  – e.g. qbinom() gives the quantile of a binomial distribution

<table>
<thead>
<tr>
<th>Distribution</th>
<th>Distribution name in R</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uniform</td>
<td>unif</td>
</tr>
<tr>
<td>Binomial</td>
<td>binom</td>

<td>lnorm</td>
</tr>
<tr>
<td>Exponential</td>
<td>exp</td>
</tr>
<tr>
<td>Student’s t</td>
<td>t</td>
</tr>
</tbody>
</table>
Distributions and Random Variables

• Generating random number from normal distribution
  > set.seed(1)
  > rnorm(2,mean=0,sd=1)
  [1] -0.6264538  0.1836433

  > pnorm(1.96)
  [1] 0.9750021

• The inverse of the above function call
  > qnorm(0.975)
  [1] 1.959964
Sorting and Random Samples

• Sort and order elements: `sort()`, `rank()` and `order()`.
  > x <- c(1.2,0.4,2.3,0.9)
  > sort(x)  ## sort x in ascending order
  > sort(x,decreasing=T) ## sort x in descending order
  > rank(x)
  [1] 3 1 4 2
  > order(x)  ## order() returns the indices of the vector in sorted order
  [1] 2 4 1 3

• Random sampling function `sample()`.
  > sample(1:4,4,replace=F)
  > sample(1:10,10,replace=F)
  > sample(1:10,10,replace=T)  ## will be different from the last run
  > sample(1:4,10,replace=T,prob=c(.2,.5,.2,.1))

• Using the same seed value through `set.seed()` can reproduce the same outcome.
  > set.seed(1)
  > sample(1:4,10,replace=T)
  [1]  2  2  3  4  1  4  4  3  3  1
  > set.seed(1)
  > sample(1:4,10,replace=T)
  [1]  2  2  3  4  1  4  4  3  3  1
The table Function

- The `table()` function is useful to tabulate factors or find the frequency of an object.
- Example: The quine dataset consists of 146 rows describing children's ethnicity (Eth), age (Age), sex (Sex), days absent from school (Days) and their learning ability (Lrn).
  - If we want to find out the frequency of the age classes in quine dataset
    ```r
    > library(MASS)
    > table(quine$Age)
    F0 F1 F2 F3
    27 46 40 33
    ```
  - If we need to know the breakdown of ages according to sex
    ```r
    > table(quine$Sex,quine$Age)
    F0  F1  F2  F3
    F 10  32  19  19
    M 17  14  21  14
    ```
The `apply` Function

- The `apply()` function evaluate a function over the margins of an array
  - More concise than the `for` loops (not necessarily faster)

# X: array objects
# MARGIN: a vector giving the subscripts which the function will be applied over
# FUN: a function to be applied

```r
> str(apply)
function (X, 2, FUN, ...)
```
\[ x \leftarrow \text{matrix(rnorm(200), 20, 10)} \]

# Row means
\[ \text{apply}(x, 1, \text{mean}) \]

\[
\begin{array}{c}
[1] -0.23457304 & 0.36702942 & -0.29057632 & -0.24516988 & -0.02845449 & 0.38583231 \\

25\% & -0.259203 & -0.1798460 \\
75\% & 1.081322 & 0.8306676 \\
\end{array}
\]
Other apply Functions

- **lapply** - Loop over a list and evaluate a function on each element
- **sapply** - Same as `lapply` but try to simplify the result
- **tapply** - Apply a function over subsets of a vector
- **mapply** - Multivariate version of `lapply`
User Defined Functions

• Similar to other languages, functions in rare defined by using the `function()` directives
• The return value is the last expression in the function body to be evaluated
• Functions can be nested
• Functions are R objects
  – For example, they can be passed as an argument to other functions
Example of User Defined Function

# Syntax
# function_name <- function (arguments) {
#   statement
# }
#
# Define the function for the power calculation
> pow <- function(x, y) {
+    result <- x^y
+}

# Call the function
> c <- pow(4, 2)
> c
[1] 16
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
    – How to install and load R packages
• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Installing and Loading R Packages - PC

• Installation:
  – Option 1: menu item
  – Option 2: run `install.packages("<package name>")` function in the console

• Loading: the `library(<package name>)` function load previously installed packages
Installing and Loading R Packages - Cluster

• Installation
  – You most likely do NOT have root privilege
  – Point the environment variable `R_LIBS_USER` to a desired location
  – In the R console, libraries that R currently searching can be shown with `.libPaths()`
  – Use the `install.packages("<package name>")` function to install a library

• Loading: the `library(<package name>)` function load previously installed packages
```r
[ychen64@mike002 ~]$ export R_LIBS_USER=/home/ychen64/packages/R/libraries
[ychen64@mike002 ~]$ echo $R_LIBS_USER
/home/ychen64/packages/R/libraries
[ychen64@mike002 ~]$ R

R version 3.3.3 (2017-03-06) -- "Another Canoe"
Copyright (C) 2017 The R Foundation for Statistical Computing
Platform: x86_64-pc-linux-gnu (64-bit)

> .libPaths()
[1] "/home/ychen64/packages/R/libraries"
[2] "/home/packages/r/3.4.3/INTEL-18.0.0/lib64/R/library"

> install.packages("swirl")
> library(swirl)

| Hi! Type swirl() when you are ready to begin.
```
Listing and Unloading
R Packages - PC and Cluster

• List all available packages `library()`, press “q” to quit
• List all packages in the default library (on the SuperMike2 cluster the default is `/home/packages/r/3.4.3/INTEL-18.0.0/lib64/R/library`)
  `library(lib = .Library)`
• Show currently loaded libraries: the `search()` function
• Unload `detach(package:<package name>)`
[ychen64@mike002 ~]$ R

R version 3.3.3 (2017-03-06) -- "Another Canoe"
Copyright (C) 2017 The R Foundation for Statistical Computing
Platform: x86_64-pc-linux-gnu (64-bit)

... 

> library()
> library(lib = .Library)

> search()
[1] ".GlobalEnv" "package:swirl" "package:stats"
[10] "package:base"

> detach(package:swirl)
Updating and Uninstall R Packages - PC and Cluster

- **Update** `update.packages("<package name>")`
- **Uninstall** `remove.packages("<package name>")`
- Documentation page: http://www.hpc.lsu.edu/docs/faq/installation-details.php
[ychen64@mike002 ~]$ R

> remove.packages("swirl")
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
  – Data inspection
  – Report generation
Steps for Data Analysis

• Get the data
• Read and inspect the data
• Preprocess the data (remove missing and dubious values, discard columns not needed etc.)
• Analyze the data
• Generate the report
How does R work

- R works best if you have a dedicated folder for each separate project - the working folder. Put all data files in the working folder (or in subfolders).

  > getwd()  # Show current working directory
  [1] "/home/ychen64"
  > dir.create("data")  # Create a new directory
  > getwd()
  [1] "/home/ychen64"
  > setwd("data")
  > getwd()
  [1] "/home/ychen64/data"
  > list.files()  # List files in current directory

- Work on the project - your objects can be automatically saved in the .RData file

- To quit use q() or CTRL + D or just kill the window. R will automatically ask you “Save workspace image?”. You can choose:
  - No: leave R without saving your results in R (recommended);
  - Yes: save your results in .RData in your working directory;
  - Cancel: not quitting R.
Case Study: Forbes Fortune List

- The forbes dataset consists of 2000 rows (observations) describing companies’ rank, name, country, category, sales, profits, assets and market value.
Getting Data

• Downloading files from internet
  – Manually download the file to the working directory
  – or with R function `download.file()`

```r
```
Reading and Writing Data

- R understands many different data formats and has lots of ways of reading/writing them (csv, xml, excel, sql, json etc.)

<table>
<thead>
<tr>
<th>Function</th>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read.table</td>
<td>write.table</td>
<td>for reading/writing tabular data</td>
</tr>
<tr>
<td>read.csv</td>
<td>write.csv</td>
<td></td>
</tr>
<tr>
<td>readLines</td>
<td>writeLines</td>
<td>for reading/writing lines of a text file</td>
</tr>
<tr>
<td>source</td>
<td>dump</td>
<td>for reading/writing in R code files</td>
</tr>
<tr>
<td>dget</td>
<td>dput</td>
<td>for reading/writing in R code files</td>
</tr>
<tr>
<td>load</td>
<td>save</td>
<td>for reading in/saving workspaces</td>
</tr>
</tbody>
</table>
Reading Data with \texttt{read.table}(1)

\begin{verbatim}
# List of arguments of the read.table() function
> str(read.table)
function (file, header = FALSE, sep = "", quote = "\"\", dec = ".", row.names,
col.names, as.is = !stringsAsFactors, na.strings = "NA", colClasses = NA, nrow = -1,
skip = 0, check.names = TRUE, fill = !blank.lines.skip, strip.white = FALSE,
blank.lines.skip = TRUE, comment.char = "#", allowEscapes = FALSE, flush = FALSE,
stringsAsFactors = default.stringsAsFactors(), fileEncoding = "", encoding = "unknown",
text, skipNul = FALSE)
\end{verbatim}
Reading Data with `read.table()`

- **file** - the name of a file, or a connection
- **header** - logical indicating if the file has a header line
- **sep** - a string indicating how the columns are separated
- **na.strings** - a character vector of strings which are to be interpreted as `NA` values
- **nrows** - the number of rows in the dataset
- **comment.char** - a character string indicating the comment character
- **skip** - the number of lines to skip from the beginning
- **stringsAsFactors** - should character variables be coded as factors?
Reading Data with `read.table()`

- The function will
  - Skip lines that begin with `#`
  - Figure out how many rows there are (and how much memory needs to be allocated)
  - Figure out what type of variable is in each column of the table
- Telling R all these things directly makes R run faster and more efficiently.
- `read.csv()` is identical to `read.table()` except that the default separator is a comma.

```r
> forbes <- read.csv("Forbes2000.csv",header=T,stringsAsFactors = FALSE,na.strings ="",sep="","")
```
Reading EXCEL spreadsheets

• The XLConnect library can open both .xls and .xlsx files. It is Java-based, so it is cross platform. But it may be very slow for loading large datasets.

```r
> library(XLConnect)
wb <- loadWorkbook("Forbes2000.xls")
setMissingValue(wb, value = c("NA"))
forbes <- readWorksheet(wb, sheet=1, header=TRUE)
dim(forbes)
[1] 2000 8
```

• There are at least two other ways: read.xlsx from library(xlsx) (slow for large datasets) and read.xls from library(gdata) (require PERL installed).

```r
> library(xlsx)
> forbes <- read.xlsx("Forbes2000.xls", 1)
```

• Note: the libraries above requires both Java Dev Kit and rJava library. The later is not available for R version installed on QB2 and SuperMic.
Outline

• R basics
  – What is R
  – How to run R codes
  – Basic syntax
  – R as a calculator
  – Data classes and objects in R
  – Flow control structures
  – Functions
  – How to install and load R packages

• Data analysis
  – Data acquisition
    – Data inspection
    – Report generation
Inspecting Data (1)

- `head()`: print the first part of an object
- `tail()`: print the last part of an object

```r
> head(forbes)
 rank  name          country            category     sales  profits
 1 1  Citigroup United States           Banking   94.71    17.85
 2 2  General Electric United States     Conglomerates  134.19   15.59
 3 3  American Intl Group United States  Insurance    76.66     6.46
 4 4   ExxonMobil United States Oil & gas operations  222.88   20.96
 5 5       BP United Kingdom Oil & gas operations  232.57   10.27
 6 6 Bank of America United States       Banking    49.01    10.81

 assets  marketvalue
 1  1264.03          255.30
 2   626.93          328.54
 3   647.66          194.87
 4   166.99          277.02
 5   177.57          173.54
 6   736.45          117.55
```
Inspecting Data (2)

• Summary of the “forbes” dataframe.

```r
> str(forbes)
'data.frame': 2000 obs. of 8 variables:
$ rank    : num 1 2 3 4 5 6 7 8 9 10 ...
$ name    : chr "Citigroup" "General Electric" "American Intl Group" "ExxonMobil" ...
$ country : chr "United States" "United States" "United States" "United States" ...
$ category: chr "Banking" "Conglomerates" "Insurance" "Oil & gas operations" ...
$ sales   : num 94.7 134.2 76.7 222.9 232.6 ...
$ profits : num 17.85 15.59 6.46 20.96 10.27 ...
$ assets  : num 1264 627 648 167 178 ...
$ marketvalue: num 255 329 195 277 174 ...
```
Inspecting Data (3)

- Statistical summary of the “Forbes” dataframe.

```r
> summary(forbes)

rank            name             country            category
1st Qu.: 500.8   Class :character Class :character Class :character
Median :1000.5   Mode  :character Mode  :character Mode  :character
Mean   :1000.5
3rd Qu.:1500.2
Max.   :2000.0

sales            profits             assets          marketvalue
Min.   :  0.010   Min.   :-25.8300   Min.   :   0.270   Min.   :  0.02
1st Qu.:  2.018   1st Qu.:  0.0800   1st Qu.:   4.025   1st Qu.:  2.72
Median :  4.365   Median :  0.2000   Median :   9.345   Median :  5.15
Mean   :  9.697   Mean   :  0.3811   Mean   :  34.042   Mean   : 11.88
3rd Qu.:  9.547   3rd Qu.:  0.4400   3rd Qu.:  22.793   3rd Qu.: 10.60
Max.   :256.330   Max.   : 20.9600   Max.   :1264.030   Max.   :328.54
NA's   :5
```

- There are missing values in the profits category.
Inspecting Data (4) - Basic Plots

- R offers a remarkable variety of graphics.
  > attach(forbes) # attach the data frame
  > boxplot(sales) # boxplot
  > plot(sales,assets) # scatterplot

- The result of a graphical function cannot be assigned to an object but is sent to a graphical device (i.e. a graphical window or a file)

- Save plots. For example:
  - pdf, two plots will be saved into one pdf file
    > pdf('rplot%03d.pdf')
    > boxplot(sales)
    > plot(sales,assets)
    > dev.off() # must turn off the graphical device
  - jpg, two plots will be saved into two jpg files
    > jpeg('rplot%03d.jpg')
    > boxplot(sales)
    > plot(sales,assets)
    > dev.off() # must turn off the graphical device
Outline

• R basics
  – What is R
  – How to run R codes

Report Generation with R Markdown

• R markdown
  – Allows one to generate dynamic report by weaving R code and human readable texts together

• The `knitr` and `rmarkdown` packages can convert them into documents of various formats

• Help make your research reproducible
Put Everything Together

- Run R commands in batch mode with `Rscript`

```
[ychen64@mike001 R]$ cat forbes.R
# Check if the data directory exists; if not, create it.
if (!file.exists("data")) {
  dir.create("data")
}

# Check if the data file has been downloaded; if not, download it.
if (!file.exists("Forbes2000.csv")) {
}
...

[ychen64@make001 R]$ Rscript forbes.R
```
Not Covered

- Data manipulation
- Statistical analysis (e.g. regression models, machine learning/data mining)
- Advanced graphics in R
- Parallel processing in R
Learning R

• User documentation on CRAN
  – An Introduction on R: http://cran.r-project.org/doc/manuals/r-release/R-intro.html

• Online tutorials (tons of them)
  – http://www.cyclismo.org/tutorial/R/

• Online courses (e.g. Coursera)

• Educational R packages
  – Swirl: Learn R in R
Next Tutorial – Data Analysis in R

• you will learn the data analysis fundamentals with applications in R.
• The data pre-processing using R will be introduced first, then some basic statistical analysis methods such as linear regression, classification as well as re-sampling methods for the basic machine learning will be covered
• Date: October 17th, 2018
More R Tutorials – Data Visualization in R

• This training provided an introduction to the R graphics in detail
• An overview on how to create and save graphs in R, then focus on the ggplot2 package.
• http://www.hpc.lsu.edu/training/archive/tutorials.php
More R Tutorials – Parallel Computing with R

• This training focused on how to use the "parallel" package in R and a few related packages to parallelize and enhance the performance of R programs

• http://www.hpc.lsu.edu/training/archive/tutorials.php

Questions?
Exercises 1

1. Create a vector of the positive odd integers less than 100 (Hint: use seq function).
2. Remove the values greater than 60 and less than 80.
3. Create a data frame called cone with two elements:
   
   ```
   R <- c(2.27, 1.98, 1.69, 1.88, 1.64, 2.14)
   H <- c(8.28, 8.04, 9.06, 8.70, 7.58, 8.34)
   
   Recall the volume of a cone with radius R and height H is given by
   \( \frac{1}{3} \pi R^2 H \). Make the third element as V, which is the volume of the cone.
   ```
Preprocessing - Missing Values

• Missing values are denoted in R by NA or NaN for undefined mathematical operations.
  – is.na() is used to test objects if they are NA

• Make sure when reading data R can recognize the missing values. E.g.
  setMissingValue(wb, value = c("NA")) when using XLConnect

• Many R functions also have a logical “na.rm” option
  – na.rm=TRUE means the NA values should be discarded
    mean(weight,na.rm=T)

• Note: Not all missing values are marked with “NA” in raw data!
Preprocessing - Missing Values

• There are many statistical techniques that can deal with the missing values, but the simplest way is to remove them.
  – If a row (observation) has a missing value, remove the row with `na.omit()`. e.g.
    ```r
    > forbes <- na.omit(forbes)
    > dim(forbes)
    ```
  – If a column (variable) has a high percentage of the missing value, remove the whole column or just don’t use it for the analysis
Preprocessing - Subsetting Data (1)

• At most occasions we do not need all of the raw data
• There are a number of methods of extracting a subset of R objects
• Subsetting data can be done either by row or by column
Preprocessing - Subsetting Data (2)

• Subsetting by row: use conditions

```r
# Find all companies with negative profit
> forbes[forbes$profits < 0, c("name", "sales", "profits", "assets")]
   name     sales  profits  assets
350 Allianz Worldwide  96.88  -1.23  851.24
354          Vodafone  47.99  -15.51  256.28
364   Deutsche Telekom  56.40  -25.83  132.01
```
Preprocessing - Subsetting Data (3)

• Subsetting by row: use the `subset()` function

# Find the business category to which most of the Bermuda island companies belong.

```r
> Bermudacompp <- subset(forbes, country == "Bermuda")
> table(Bermudacompp[,]"category") # frequency table of categories

  Banking Capital goods Conglomerates Food drink & tobacco Food markets Insurance Media Oil & gas operations Software & services
  1          1          2               1          1          10             1          2          1
```
• Subsetting by column

```r
# Create another data frame with only numeric variables

forbes2 <- data.frame(sales=forbes$sale, profits=forbes$profits,
                        assets=forbes$assets, mvalue=forbes$marketvalue)
str(forbes2)

# Or simply use indexing

forbes3 <- forbes[,c(5:8)]
str(forbes3)
```
Exercises 2

1. Import dataset forbes, save it as forbes
2. Run the following commands:
   head(forbes)
   str(forbes)
   summary(forbes)
3. Remove the observations with missing values
4. Find all German companies with negative profit
5. Find the 50 companies in the Forbes dataset with the highest profit
6. Find the average value of sales for the companies in each country (Hint: use tapply function)
7. Find the number of companies in each country with profits above 5 billion US dollars
