

# **HPC User Environment 2**

Feng Chen HPC User Services LSU HPC & LONI sys-help@loni.org

Louisiana State University Baton Rouge September 16, 2020

### **Outline**

- Review HPC User Environment 1 topics
  - Available HPC resources
  - Accounts and Allocations
  - Cluster architecture
  - Connect to clusters
  - Software management using module

### Things to be covered in this training

- Job management
  - Interactive vs Batch jobs
  - Submit and monitor your jobs
- Understanding Job scheduling
  - Job priority
  - Backfill
- Compiling and analyze codes on cluster
  - Serial program
  - Parallel program

HPC User Environment 2

# **Brief Review of Session 1**

### **Inside A Cluster Rack**

## Inside A QB2 Compute Node (Dell C8000)

HPC User Environment 2 Fall 2020

### **Conceptual Relationship**

### **Cluster Nomenclature**

Term	Definition						
Cluster	The top-level organizational unit of an HPC cluster, comprising a set of nodes, a queue, and jobs.						
Node	A single, named host machine in the cluster.						
Core	The basic computation unit of the CPU. For example, a quad-core processor is considered 4 cores.						
Job	A user's request to use a certain amount of resources for a certain amount of time on cluster for his work.						

#### HPC User Environment 2 Fall 2020

### **HPC Cluster Architectures**

#### > Major architecture

- Intel x86\_64 clusters
  - Vendor: Dell
  - Operating System: Linux (RHEL 4/5/6)
  - Processor: Intel

## Accessing cluster using ssh (Secure Shell)

#### On Unix and Mac

- use ssh on a terminal to connect

### Windows box (ssh client):

- MobaXterm (<u>http://mobaxterm.mobatek.net/</u>, recommended)
- Putty, Cygwin (<u>http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html</u>)
- > ssh username@mike.hpc.lsu.edu

### Host name

- LONI: <cluster\_name>.loni.org
  - <cluster\_name> can be:
    - qb.loni.org
    - qbc.loni.org
- LSU HPC: <cluster\_name>.hpc.lsu.edu
  - <cluster\_name> can be:
    - mike.hpc.lsu.edu
    - smic.hpc.lsu.edu
    - philip.hpc.lsu.edu

## **QB3 in Friendly User Mode**

- QB3 is an 857 TeraFlop peak performance cluster with 9,696 CPU cores, comprised of 202 compute nodes connected by 100 Gbps Infiniband fabric
  - 192 regular nodes: two 24-core Intel Cascade Lake CPUs, 192 GB RAM
  - 8 GPU nodes: two 24-core Intel Cascade Lake CPUs, 192 GB RAM, two NVIDIA Tesla V100 GPUs
  - 2 bigmem nodes: two 24-core Intel Cascade Lake CPUs, 1.5 TB RAM
- Iog in QB3 with your current LONI HPC credentials using
  - ssh qbc.loni.org
- Before you submit jobs on QB3, please make sure that you review the user guide here:
  - <u>http://www.hpc.lsu.edu/docs/guides.php?system=QB3</u>
- "Friendly user mode", which means that the hardware/software configuration and policy may change without advance notice.
- The biggest difference QB2 users would notice on QB3 is that, instead of Torque/Moab, *Slurm* is employed as the workload and resource manager.

HPC User Environment 2

# **Review Questions for Section 1**

### Access to cluster

#### How do I connect to HPC/LONI cluster?

- a) By logging onto HPC webpage at www.hpc.lsu.edu
- b) Using an ssh (secure shell) client such as MobaXterm/Putty
- c) Go to the machine room in ISB in downtown Baton Rouge and connect my laptop to the nodes using a cable <sup>(2)</sup>

### Software Management

- How do we manage the software installed on HPC/LONI clusters?
  - Using the modules command
  - Using a drop down menu on the <u>www.hpc.lsu.edu</u> webpage
- Recall the basic 5 module commands, what are they used for?
  - module av
  - module li
  - module disp
  - module load/unload <key>
  - module swap <key1> <key2>

### **Account and Allocation Policy**

- > Who can apply for allocations?
  - a) Graduate student
  - b) PostDoc
  - c) Full time faculty
  - d) All of the above

### **Account Security**

#### How to get your account suspended?

- a) Give your password to your friend/lab colleagues and let him/her use it.
- b) Give your password to your advisor so he/she can use your account to see your data.
- c) Run my simulation on the login node.
- d) All of the above

HPC User Environment 2

# **More on Job Queues**

### **Cluster Environment**

- Multiple compute nodes
- Multiple users
- Each user may have multiple jobs running simultaneously
- Multiple users may share the same node

### Job submission basics

- 1. Find appropriate queue
- 2. Understand the queuing system and your requirements and proceed to submit jobs
- 3. Monitor jobs during execution

### **Job Queues**

- > Nodes are organized into queues. Nodes can be shared.
- Each job queue differs in
  - Number of available nodes
  - Max run time
  - Max running jobs per user
  - Nodes may have special characteristics: GPU/Xeon Phi's, Large memory, etc.
- Jobs need to specify resource requirements
  - Nodes, time, queue
- Its called a queue for a reason, but jobs don't run on a "First Come First Served" policy,
  - This will be detailed in later slides

### Queue Characteristics – LONI clusters

Machine	Queue	Max Runtime	ppn	Max running jobs	Max nodes per job	Use
QB2	workq		20		128	Unpreemptable
	checkpt	3 days	20	44	256	Preemptable
	single	7 days	1,2,4,6,8		1	ppn=1/2/4/6/8

## Queue Characteristics – LSU Linux clusters

Machine	Queue	Max Runtime	ppn	Max running jobs	Max nodes per job	Use
	workq	2 days	16		128	Unpreemptable
	checkpt	3 days	16	34	128	Preemptable
SuperMike II	bigmem	2 days	16		1	Big memory
	gpu	3 days	16		16	Job using GPU
	single	3 days	1,2,4,8		1	Single node jobs
	workq		8	5	4	Unpreemptable
	checkpt	3 days	8		4	Preemptable
Philip	bigmem		8		2	Big memory
	single	14 days	4	50	1	Single processor
SuperMIC	workq	2 dave	20	34	128	Unpreemptable
SuperMIC	checkpt	3 days	20	34	360	Preemptable

### **Queue Characteristics**

#### "qstat -q" will give you more info on the queues

[fchen14@mike2 ~]\$ qstat -q

#### server: mike3

Queue	Memory	CPU Time	Walltime	Node	Run	Que	Lm	State
workq			72:00:00	128	31	6		ER
mwfa			72:00:00	8	3	0		ER

•••					

HPC User Environment 2

# **Submit and Monitor Your Jobs**

### Two Job Types

#### Interactive job

- Set up an interactive environment on compute nodes for users
  - Advantage: can run programs interactively
  - Disadvantage: must be present when the job starts
- Purpose: testing and debugging, compiling
  - Do not run on the head node!!!
  - Try not to run interactive jobs with large core count, which is a waste of resources)

### Batch job

- Executed without user intervention using a job script
  - Advantage: the system takes care of everything
  - Disadvantage: can only execute one sequence of commands which cannot changed after submission
- Purpose: production run

### Submitting Jobs on Linux Clusters

#### Interactive job example:

- qsub −I -X \
  - -1 walltime=<hh:mm:ss>,nodes=<num\_nodes>:ppn=<num\_cores> \
  - -A <Allocation>  $\$
  - -q <queue name>

#### DO NOT directly **ssh** to compute nodes, unless the nodes are assigned to you by the job scheduler.

Add -X to enable X11 forwarding

#### Batch Job example:

qsub job\_script

### **Check Your Available Allocations**

Proj. Nameļ	Alloc	Balance  De	eposited	%Used  Days Left	End
npc_hpcadmin3 hpc npc_trn17mike2 hp	— •	6 1	•	•	•
Note: Balance and	l Deposit are	measured in	ı CPU-hours		
[fchen14@mike2 ~]	<pre>\$ showquota</pre>

\$PBS_O_WORKDIR	\$PBS_VNODENUM		

### PBS Job Script – Serial Job

#!/bin/bash		
<pre>#PBS -1 nodes=1:ppn=1</pre>	# Number of nodes and processor	
<pre>#PBS -1 walltime=24:00:00</pre>	# Maximum wall time	
#PBS -N myjob	# Job name	Tells the job
<pre>#PBS -o <file name=""></file></pre>	<pre># File name for standard output</pre>	scheduler
<pre>#PBS -e <file name=""></file></pre>	<pre># File name for standard error</pre>	how much
#PBS -q single	<pre># The queue for serial jobs</pre>	resource you
<pre>#PBS -A <loni_allocation></loni_allocation></pre>	<pre># Allocation name</pre>	need.
#PBS -m e	<pre># Send mail when job ends</pre>	
<pre>#PBS -M <email address=""></email></pre>	# Send mail to this address	

<shell commands>
<path\_to\_executable> <options>
<shell commands>

How will you use the resources?

### PBS Job Script – Parallel Job

#!/bin/bash		
<pre>#PBS -1 nodes=2:ppn=16</pre>	#Number of nodes and processors	per node
<pre>#PBS -1 walltime=24:00:00</pre>	#Maximum wall time	
#PBS -N myjob	#Job name	Tells the
<pre>#PBS -o <file name=""></file></pre>	<pre>#File name for standard output</pre>	scheduler
<pre>#PBS -e <file name=""></file></pre>	<pre>#File name for standard error</pre>	how much
#PBS -q checkpt	#Queue name	resource
<pre>#PBS -A <allocation_if_needed></allocation_if_needed></pre>	#Allocation name	you need.
#PBS -m e	#Send mail when job ends	
<pre>#PBS -M <email address=""></email></pre>	#Send mail to this address 🥏 🦯	
<shell commands=""></shell>		
<pre>mpirun -machinefile \$PBS_NODEFI</pre>	<pre>LE -np 32 <path_to_executable>&lt;</path_to_executable></pre>	options>
<shell commands=""></shell>		How will

you use the resources?

### True or False?

- I have the below job script on QB2, since I used nodes=2:ppn=20, my script will run in parallel using 2 nodes with 40 cores.
  - a) True
  - b) False
- #!/bin/bash
  #PBS -1 nodes=2:ppn=20
  #PBS -1 walltime=24:00:00
  #PBS -N myjob
  #PBS -j oe
  #PBS -j oe
  #PBS -q checkpt
  #PBS -A my allocation

./my\_executable.out

### Job Monitoring - Linux Clusters

#### Check details on your job using qstat

- \$ qstat -n -u \$USER : For quick look at nodes assigned to you
- \$ qstat -f jobid : For details on your job
- \$ qdel jobid : To delete job
- Check approximate start time using showstart
  - \$ showstart jobid
- Check details of your job using checkjob
  - \$ checkjob jobid
- Check health of your job using qshow
  - \$ qshow jobid
- Please pay close attention to the load and the memory consumed by your job!

### Using the "top" command

The top program provides a dynamic real-time view of a running system.

top - 19:39:56 up 89 days, 4:13, 1 user, load average: 0.63, 0.18, 0.06
Tasks: 489 total, 2 running, 487 sleeping, 0 stopped, 0 zombie
Cpu(s): 6.3%us, 0.0%sy, 0.0%ni, 93.7%id, 0.0%wa, 0.0%hi, 0.0%si, 0.0%st
Mem: 65909356k total, 3389616k used, 62519740k free, 151460k buffers
Swap: 207618040k total, 5608k used, 207612432k free, 947716k cached

_	PTD USER	PR	NT	VTRT	RES	SHR	S	%CPU	%MFM	TTME+	COMMAND
	39595 fcher	14 20	0	266m	257m	592	R	99.9	0.4	0:06.94	a.out
	39589 fcher	14 20	Ø	17376	1612	980	R	0.3	0.0	0:00.05	top
	38479 fcher	14 20	0	<b>108</b> m	<b>2156</b>	<b>1348</b>	S	0.0	0.0	0:00.03	bash
	39253 fcher	14 20	0	<b>103m</b>	1340	1076	S	0.0	0.0	0:00.00	236297.mike3.SC
	39254 fcher	14 20	0	<b>103m</b>	<b>1324</b>	1060	S	0.0	0.0	0:00.00	<pre>bm_laplace.sh</pre>
	39264 fcher	14 20	0	<b>99836</b>	<b>1908</b>	<b>992</b>	S	0.0	0.0	0:00.00	sshd
	39265 fcher	14 20	0	<b>108</b> m	3056	1496	S	0.0	0.0	0:00.03	bash

### Pay attention to single queue usage

- Single queue Used for jobs that will only execute on a single node, i.e. nodes=1:ppn=1/2/4/6/8.
- Jobs in the single queue should not use:
  - More than 2GB memory per core for Eric, Philip and SuperMike2 (32G/16).
  - More than 3.2GB memory per core for QB2 (64G/20).
- If applications require more memory, scale the number of cores (ppn) to the amount of memory required: i.e. max memory available for jobs in single queue is 8GB for ppn=4 on SuperMikell.
- > Typical type of warning:
  - E124 Exceeded memory allocation. This Job XXXX appears to be using more memory (GB) than allocated (9 > 3).
  - E123 Exceeded ppn/core allocation. This Job XXXX appears to be using more cores than allocated (6 > 1). Please allocate the number of cores that the job will use, (ppn=6). This Job has 1 core(s) allocated (ppn=1).

### Core and Memory in Single queue

64/20=3.2GB

#### **Question:**

On QB2, if my job needs 7GB memory, what ppn value should I use? On SuperMike2, if my job needs 7GB memory, what ppn value should I use?

### More things to be noticed

- Eric is old and will be retired in the near future LONI users are encouraged to migrate their codes to QB-2 as soon as possible.
- The purpose of bigmem queue on QB-2 is for jobs costing big (larger than 64 GB) memory not for jobs using more number of cores.
- ➢ GPU is available to workq or checkpt queues on QB-2.
- Xeon Phi is available to workq or checkpt queues on SuperMIC.
- There is no single queue on SuperMIC.
- Users are encouraged to use accelerators (GPU/Xeon Phi) whenever possible. Application for allocation involving with usage of accelerators will be easier to be approved.

#### Job Submission Quiz

#### How to suspend your account? (cont'd)

- Use more memory than allowed. (e.g. use 5GB memory on SuperMike2 with ppn=1)
- Seriously underutilize node resources (e.g. allocate 32 nodes but just use 1 core)
- Submit job to the big memory queue but use only few MB of memory
- How to monitor core and memory usage?

HPC User Environment 2

# **Job Scheduling Basics**

#### **Back to Cluster Architecture**

- As a user, you interact with the scheduler and/or resource manager whenever you submit a job, or query on the status of your jobs or the whole cluster, or seek to manage your jobs.
- Resource managers give access to compute resource
  - Takes in a resource request (job) on login node
  - Finds appropriate resource and assigns you a priority number
  - Positions your job in a queue based on the priority assigned.
  - Starts running jobs until it cannot run more jobs with what is available.

#### Job Scheduler

- HPC & LONI Linux clusters use TORQUE, an open source version of the Portable Batch System (PBS) together with the MOAB Scheduler, to manage user jobs.
- Resource Manager Torque
  - Manages a queue of jobs for a cluster of resources
  - Launches job to a simple FIFO job queue
- Workload Manager Moab
  - A scheduler that integrates with one or more Resource Managers to schedule jobs across domains of resources (servers, storage, applications)
  - Prioritizes jobs
  - Provides status of running and queued jobs, etc.
- The batch queuing system determines
  - The order jobs are executed
  - On which node(s) jobs are executed

### Job management philosophy

#### Working Philosophy

- Prioritize workload into a queue for jobs
- Backfill idle nodes to maximize utilization
  - Will be detailed later...

Res( Proc)

10)

30(

#### **Job Priorities**

- Jobs with a higher job priority are scheduled ahead of jobs with a lower priority.
- Job priorities have contributions from the following:
  - credential priority
  - fairshare priority
  - resource priority
  - service priority
- Priority determination for each queued job, use

```
mdiag -p:
    •
$ mdiag -p
diagnosing job priority information (partition: ALL)
                         Cred(User:Class) FS(User: WCA) Serv(QTime:XFctr)
Job
              PRIORITY*
      Weights -----
                          100(
                                10:
                                      10)
                                            100(
```

236172	246376	40.6(100.0:	0.0)	8.6( 19.6:	0.3)	4.0(1480.: 99.7)	46.8(2048.)
235440	242365	41.3(100.0:	0.0)	4.6( 8.2:	0.6)	6.6(3959.: 6.5)	47.5(512.0)
235441	242365	41.3(100.0:	0.0)	4.6( 8.2:	0.6)	6.6(3959.: 6.5)	47.5(512.0)

236396	241821	41.4(100.0:	0.0)	8.8( 19.6:	0.3)	2.2(664.0: 67.4)	47.6(1456.)

10:

50)

2(

2:

20)

#### **Priority components**

Credential priority = credweight \* (userweight \* job.user.priority) = 100 \* (10 \* 100) = 100000

It is a constant for all users.

Fairshare priority = fsweight \* min (fscap,(fsuserweight\*DeltaUserFSUsage)) = 100 \* (10 \* DeltaUserFSUsage)

If you have not submitted jobs in the past 7 days, DeltaUserFSUsage = 20000

Service priority = serviceweight \* (queuetimeweight \* QUEUETIME + xfactorweight \* XFACTOR)

= 2 \* (2 \* QUEUETIME + 20 \* XFACTOR ),

where XFACTOR = 1 + QUEUETIME / WALLTIMELIMIT.

Resource priority = resweight \* min (rescap, (procweight \*

TotalProcessorsRequested)

= 30 \* min (3840, (10 \* TotalProcessorsRequested)

See <u>http://www.hpc.lsu.edu/docs/pbs.php</u>, click "Job priority".

### How to get higher priority?

- Do not submit too many jobs within one week.
- Submit your job early to accumulate the queue time.
- More on resource priority:
  - Request more compute nodes.
  - Request a smaller walltime limit.
  - see next few slides...

#### How to maximize the usage of a cluster?

- Fill in high-priority (large) jobs
- Backfill low-priority (small) jobs

#### HPC User Environment 2 Fall 2020

## An Overview of Backfilling (1)

- Backfill is a scheduling optimization that allows a scheduler to make better use of available resources by running jobs out of order.
- Enabling backfill allows the scheduler to start other, lower-priority jobs so long as they do not delay the highest priority job.
- If the FIRSTFIT algorithm is applied, the following steps are taken:
  - The list of feasible backfill jobs is filtered, selecting only those that will actually fit in the current backfill window.
  - The first job is started.
  - While backfill jobs and idle resources remain, repeat step 1.

### An Overview of Backfilling (2)

- Although by default the start time of the highest priority job is protected by a reservation, there is nothing to prevent the third priority job from starting early and possibly delaying the start of the second priority job.
- Command to show current backfill windows:
  - showbf
    - Shows what resources are available for immediate use.
    - This command can be used by any user to find out how many processors are available for immediate use on the system. It is anticipated that users will use this information to submit jobs that meet these criteria and thus obtain quick job turnaround times.
  - Example:

[fchen14@eric2 ~]\$ showbf -c workq						
Partition	Tasks	Nodes	Duration	Start0ffset	StartDate	
ALL	40	5	18:50:35	00:00:00	11:16:49_09/04	
ALL	8	1	INFINITY	00:00:00	11:16:49_09/04	

### How Much Time Should I Ask for?

#### It should be

- Long enough for your job to complete
- As short as possible to increase the chance of backfilling

#### **Frequently Asked Questions**

- > I submitted job A before job B. Why job B started earlier than job A?
- There are free nodes available, why my job is still waiting and not running?
- Why my job is not get accelerated when running on cluster?
  - Is your job utilizing the parallel resource on the cluster?
  - Does you job have lots of I/O tasks?
  - See next section...

HPC User Environment 2

# Compile and Analyze Codes on Cluster

#### **Compilers**

#### > Serial compilers

	Linux cluster				
Language	Intel	PGI	GNU		
Fortran	ifort	pgf77, pgf90	gfortran		
С	icc	pgcc	gcc		
C++	ісрс	pgCC	g++		

#### Parallel compilers

Language	Linux clusters		
Fortran	mpif77, mpif90		
С	mpicc		
C++	mpiCC		

### Example compiling serial code

- icc hello\_cpu\_elapsed.c
- gfortran test\_hello2.f90
- List symbols for executables:

nm - list symbols from object files

> Example:

[fchen14@mike2 hello]\$ nm ./a.out | grep intel
0000000000060eb60 B \_\_intel\_cpu\_indicator

[fchen14@mike2 hello]\$ nm ./a.out | grep gfortran U \_gfortran\_set\_args@@GFORTRAN\_1.0

### CPU time vs Elapsed time

#### CPU time (or process time):

 The amount of time for which a central processing unit (CPU) was used for processing instructions of a computer program or operating system, as opposed to, for example, waiting for input/output (I/O) operations or entering low-power (idle) mode.

#### Elapsed real time (or simply real time, or wall clock time)

- The time taken from the start of a computer program until the end as measured by an ordinary clock. Elapsed real time includes I/O time and all other types of waits incurred by the program.
- If a program uses parallel processing, total CPU time for that program would be more than its elapsed real time.
  - (Total CPU time)/(Number of CPUs) would be same as elapsed real time if work load is evenly distributed on each CPU and no wait is involved for I/O or other resources.

### Compiling and Analyzing C serial program

```
#include <stdio.h>
#include <time.h>
int main(char *argc, char **argv) {
    double s=0.0:
    // fundamental arithmetic type representing clock tick counts.
    clock t start, end;
    int i;
    start = clock();
    for (i=0;i<100000000;i++)</pre>
        s+=i*2.0; // doing some floating point operations
    end = clock();
    double time elapsed in seconds = (end - start)/(double)CLOCKS PER SEC;
    printf("cputime in sec: %e\n", time elapsed in seconds);
    start = clock();
    system ("sleep 5"); // just sleep, does this accumulate CPU time?
    end = clock();
    time_elapsed_in_seconds = (end - start)/(double)CLOCKS PER SEC;
    printf("cputime in sec: %e\n", time_elapsed_in_seconds);
    return 0;
```

}

#### Watch the actual cpu time using "time"

[fchen14@mike429 serial]\$ gcc hello\_cpu\_elapsed.c
[fchen14@mike429 serial]\$ time ./a.out
cputime\_in\_sec: 2.740000e+00
cputime\_in\_sec: 0.000000e+00

- real 0m7.782s
- user 0m2.750s
- sys 0m0.005s

### Some additional info about "time"

#### Use the Linux command time to evaluate the actual time usage

- time a simple command or give resource usage
- Real refers to actual elapsed time (wall clock time)
  - Time from start to finish of the call. This is all elapsed time including time used by other processes and time the process spends blocked (for example if it is waiting for I/O to complete).

#### User and Sys refer to CPU time used only by the process.

- User is the amount of CPU time spent in user-mode code (*outside the kernel*) within the process.
- Sys is the amount of CPU time spent *in the kernel* within the process.

#### > Purpose of this example:

- real < user: The process is CPU bound and takes advantage of parallel execution on multiple cores/CPUs.
- real ≈ user: The process is CPU bound and takes no advantage of parallel execution.
- real > user: The process is I/O bound. Execution on multiple cores would be of little to no advantage.

### Two parallel schemes

#### Shared Memory system

- A single multicore compute node
- Open Multi-processing (OpenMP)

#### Distributed Memory system

- Mutliple compute nodes
- Message Passing Interface (MPI)

#### **OpenMP:** Shared Memory System

Typically less memory overhead/duplication. Communication often implicit, through cache coherency and runtime.

#### 09/16/2020

#### HPC User Environment 2 Fall 2020

### Example compiling threaded OpenMP code

- Compiling OpenMP code often requires the openmp compiler flags, it varies with different compiler
- Environment Variable OMP\_NUM\_THREADS sets the number of threads
- > Examples:

[fchen14@mike2 src]\$ gcc -fopenmp hello\_openmp.c

[fchen14@mike2 src]\$ ifort -openmp hello\_openmp.f90

Compiler	Compiler Options	Default behavior for # of threads (OMP_NUM_THREADS not set)
GNU (gcc, g++, gfortran)	-fopenmp	as many threads as available cores
Intel (icc ifort)	-openmp	as many threads as available cores
Portland Group (pgcc,pgCC,pgf77,pgf90)	-mp	one thread

### Sample OpenMP C code

```
#include <omp.h>
#include <stdio.h>
#include <stdlib.h>
int main (int argc, char *argv[]) {
    int nthreads, tid;
    /* Fork a team of threads with their own copies of variables */
#pragma omp parallel private(nthreads, tid)
    {
        /* Obtain thread number */
        tid = omp get thread num();
        printf("Hello World from thread = %d\n", tid);
        /* Only master thread does this */
        if (tid == 0) {
            nthreads = omp get num threads();
            printf("Number of threads = %d\n", nthreads);
        }
    } /* All threads join master thread and disband */
}
```

### Sample OpenMP Fortran code

program hello

```
integer nthreads, tid, omp get num threads, omp get thread num
! fork a team of threads giving them their own copies of variables
!$omp parallel private(nthreads, tid)
! obtain thread number
tid = omp get thread num()
print *, 'hello world from thread = ', tid
! only master thread does this
if (tid .eq. 0) then
    nthreads = omp get num threads()
    print *, 'number of threads = ', nthreads
end if
! all threads join master thread and disband
!$omp end parallel
end
```

### Analyzing a parallel (OpenMP) program

# What will be the CPU time and elapsed time for the following code segment:

```
See (on SuperMike II):
/home/fchen14/userenv/src/openmp/hello_openmp_cpu_elapse.c
// fundamental arithmetic type representing clock tick counts.
clock t start, end;
struct timeval r start, r end;
int i;
gettimeofday(&r_start, NULL);
start = clock();
#pragma omp parallel for // spawn the openmp threads
for (i=0;i<N;i++) a = i*2.0; // doing some floating point operations
end = clock();
gettimeofday(&r end, NULL);
double cputime elapsed in seconds = (end -
start)/(double)CLOCKS_PER_SEC;
double realtime elapsed in seconds = ((r end.tv sec * 1000000 +
r end.tv usec) - (r start.tv sec * 1000000 +
r_start.tv_usec))/1000000.0;
```

### Available MPI libraries on LONI & HPC

	Name	MPI Library				Default serial compiler
Cluster Resource		Mvapich	Mvapich2	OpenMPI	MPICH	
LONI	Eric	0.98, 1.1	1.4, 1.6, 1.8.1	1.3.4	Х	Intel 11.1
	QB2	Х	2.0	1.8.1	3.0.3	Intel 14.0.2
	SuperMikeII	Х	1.9, 2.0.1	1.6.2 1.6.3 1.6.5	3.0.2	Intel 13.0.0
LSU	Philip	Х	Х	1.4.3, 1.6.1	1.2.7, 1.3.2, 1.4.1	Intel 11.1
	SuperMIC	Х	2.0	1.8.1	3.0.3 3.1.1	Intel 14.0.2

### MPI Compilers (1)

Language	Linux clusters	AIX clusters	
Fortran	mpif77, mpif90	mpxlf, mpxlf90	
С	mpicc	трсс	
C++	mpiCC	mpCC	

mpif90 hello.f90

mpicc hello.c

mpicxx hello.cpp

### MPI Compilers (2)

- > These MPI compilers are actually wrappers
  - They still use the compilers we've seen on the previous slide
    - Intel, PGI or GNU
  - They take care of everything we need to build MPI codes
    - Head files, libraries etc.
  - What they actually do can be reveal by the -show option
- It's extremely important that you compile and run your code with the same version of MPI!
  - Use the default version if possible

### Compiling a MPI C program

#### Compiling Hello world in C version:

```
    mpicc hello_mpi.c

#include <mpi.h>
#include <stdio.h>
int main(int argc, char** argv) {
    int name len, world size, world rank;
    char processor name[MPI MAX PROCESSOR NAME];
    //Initialize the MPI environment
    MPI Init(NULL, NULL);
    // Get the number and rank of processes
    MPI_Comm_size(MPI_COMM_WORLD, &world_size);
    MPI Comm rank(MPI COMM WORLD, &world rank);
    // Get the name of the processor
    MPI Get processor name(processor name, &name len);
    // Print off a hello world message
    printf("Iam from processor %s, rank %d out of %d processors\n",
            processor name, world rank, world size);
    // Finalize the MPI environment.
    MPI Finalize();
}
```

### Compiling a MPI Fortran program

#### Compiling Hello world in Fortran:

```
    mpif90 hellp_mpi.f90

program hello_mpi
    include 'mpif.h'
    !use mpi
    character 10 name
    ! Initialize the MPI library:
    call MPI Init(ierr)
    ! Get size and rank
    call MPI Comm Size(MPI COMM WORLD, numtasks, ierr)
    call MPI Comm Rank(MPI COMM WORLD, rank, ierr)
    ! print date
    if (nrank == 0) then
        write( , )'System date'
        call system('date')
    endif
    call MPI Barrier(MPI COMM WORLD, ierr)
    ! print rank
    call MPI_Get_Processor_Name(name, len, ierr)
    write( , )"I am ", nrank, "of", numtasks, "on ", name
    ! Tell the MPI library to release all resources it is using:
    call MPI_Finalize(ierr)
end program hello mpi
```

#### Always verify what compiler/library is being used:

```
$ mpicc -show
icc -I/usr/local/packages/openmpi/1.6.2/Intel-13.0.0/include -
L/usr/local/packages/openmpi/1.6.2/Intel-13.0.0/lib -lmpi -ldl -lm -
Wl,--export-dynamic -lrt -lnsl -libverbs -libumad -lpthread -lutil
```

\$ mpif90 -show ifort -I/usr/local/packages/openmpi/1.6.2/Intel-13.0.0/include -I/usr/local/packages/openmpi/1.6.2/Intel-13.0.0/lib -L/usr/local/packages/openmpi/1.6.2/Intel-13.0.0/lib -lmpi\_f90 lmpi\_f77 -lmpi -ldl -lm -Wl,--export-dynamic -lrt -lnsl -libverbs libumad -lpthread -lutil

> Always verify what library is being used: Before and after: \$ ldd a.out #ldd - print shared library dependencies linux-vdso.so.1 => (0x00007fff907ff000) libmpi\_f90.so.1 => /usr/local/packages/openmpi/1.6.2/Intel-13.0.0/lib/libmpi\_f90.so.1 (0x00002b9ae577e000) libmpi\_f77.so.1 => /usr/local/packages/openmpi/1.6.2/Intel-13.0.0/lib/libmpi\_f77.so.1 (0x00002b9ae5982000) libmpi.so.1 => /usr/local/packages/openmpi/1.6.2/Intel-

### Running and Analyzing MPI program

- Make sure you are running your jobs on the correct nodes
- Important if you want to run less processes than ppn
- Understand the usage of \$PBS\_NODEFILE

```
[fchen14@mike2 ~]$ qsub -I -X -l nodes=2:ppn=16 -l walltime=01:00:00 -q gpu
. . .
[fchen14@mike429 ~]$ echo $PBS NODEFILE
/var/spool/torque/aux//236660.mike3
[fchen14@mike429 ~]$ cat $PBS NODEFILE
mike429
              # 16 repeats of mike429
. . .
mike429
mike430
              # 16 repeats of mike430
mike430
[fchen14@mike429 hybrid]$ cat $PBS_NODEFILE| uniq > hosts
[fchen14@mike429 hybrid]$ cat hosts
mike429
mike430
```

#### Running and Analyzing MPI program

[fchen14@mike315 mpi]\$ mpicc hello mpi.c [fchen14@mike315 mpi]\$ mpirun -np 32 -hostfile \$PBSNODEFILE ./a.out Iam from processor mike315, rank 1 out of 32 processors Iam from processor mike315, rank 6 out of 32 processors Iam from processor mike315, rank 9 out of 32 processors Iam from processor mike315, rank 12 out of 32 processors Iam from processor mike315, rank 0 out of 32 processors Iam from processor mike315, rank 2 out of 32 processors Iam from processor mike315, rank 3 out of 32 processors Iam from processor mike315, rank 7 out of 32 processors Iam from processor mike315, rank 10 out of 32 processors Iam from processor mike315, rank 5 out of 32 processors Iam from processor mike315, rank 13 out of 32 processors Iam from processor mike315, rank 4 out of 32 processors Iam from processor mike315, rank 8 out of 32 processors Iam from processor mike334, rank 17 out of 32 processors Iam from processor mike315, rank 11 out of 32 processors Iam from processor mike315, rank 14 out of 32 processors Iam from processor mike315, rank 15 out of 32 processors Iam from processor mike334, rank 18 out of 32 processors

## Compiling hybrid (MPI+OpenMP) program

- See /home/fchen14/userenv/src/hybrid/hello\_hybrid.c for complete source
- Use command:
  - \$ mpicc -openmp hello\_hybrid.c

```
#pragma omp parallel default(shared) private(itd, np)
   {
       gtd = omp_get_num_threads(); //get total num of threads in a process
       itd = omp_get_thread_num(); // get thread id
       printf("Gid %d from thd %d out of %d from process %d out of %d on %s\n",
              gid, itd, gtd, nrank, numprocs, processor_name);
       if (nrank==0 && itd==0)
       {
           // system("pstree -ap -u $USER");
           system("for f in `cat $PBS NODEFILE|uniq`; do ssh $f pstree -ap -u
$USER; done;");
           system("sleep 10");
       }
   }
```

#### Analyzing a hybrid program

```
[fchen14@mike315 hybrid]$ export OMP NUM THREADS=4
[fchen14@mike315 hybrid]$ mpirun -np 2 -x OMP_NUM_THREADS ./a.out
Gid 0 from thread 0 out of 4 from process 0 out of 2 on mike315
Gid 2 from thread 2 out of 4 from process 0 out of 2 on mike315
Gid 1 from thread 1 out of 4 from process 0 out of 2 on mike315
Gid 3 from thread 3 out of 4 from process 0 out of 2 on mike315
Gid 4 from thread 0 out of 4 from process 1 out of 2 on mike315
Gid 6 from thread 2 out of 4 from process 1 out of 2 on mike315
Gid 7 from thread 3 out of 4 from process 1 out of 2 on mike315
Gid 5 from thread 1 out of 4 from process 1 out of 2 on mike315
bash,108067
  -mpirun,110651 -np 2 -x OMP NUM THREADS ./a.out
      -a.out,110652
          -sh,110666 -c ...
              -ssh,110670 mike315 pstree -ap -u fchen14
          -{a.out},110654
          -{a.out},110656
          |-{a.out},110662
          -{a.out},110663
          |-{a.out},110664
          `-{a.out},110665
```

#### Exercise

#### Submit a small job to run "sleep 180" and "print PBS variables"

- Create a script to submit a 5 min job and print from within the job script PBS variables \$PBS\_NODEFILE, \$PBS\_WORKDIR. Also run "sleep 180" to give you a few minutes to verify status.
- Once the job is running, find out the Mother Superior node and other slave nodes assigned to your job using qstat.
- Log into MS node and verify that your job is running and find your temporary output file
- Modify your script to print hello from each of your assigned nodes
- Run a shell script using mpirun to print process id of shell

## **QB3 in Friendly User Mode**

- QB3 is an 857 TeraFlop peak performance cluster with 9,696 CPU cores, comprised of 202 compute nodes connected by 100 Gbps Infiniband fabric
  - 192 regular nodes: two 24-core Intel Cascade Lake CPUs, 192 GB RAM
  - 8 GPU nodes: two 24-core Intel Cascade Lake CPUs, 192 GB RAM, two NVIDIA Tesla V100 GPUs
  - 2 bigmem nodes: two 24-core Intel Cascade Lake CPUs, 1.5 TB RAM
- Iog in QB3 with your current LONI HPC credentials using
  - ssh qbc.loni.org
- Before you submit jobs on QB3, please make sure that you review the user guide here:
  - <u>http://www.hpc.lsu.edu/docs/guides.php?system=QB3</u>
- "Friendly user mode", which means that the hardware/software configuration and policy may change without advance notice.
- The biggest difference QB2 users would notice on QB3 is that, instead of Torque/Moab, *Slurm* is employed as the workload and resource manager.

#### **Future Trainings**

- Next week training: Basic Shell Scripting
  - Wednesday 9:00am, September 23, Via Zoom
- Next week training: QB3 Launch Workshop (Tentative)
  - Thursday, 9:00am, October 1, Via Zoom
- Keep an eye on our webpage: www.hpc.lsu.edu
